What is NXTMMX-v2

NXTMMX is a multiplexer to control additional NXT (or EV3) Motors from your NXT or EV3.

Connections and Placement

NXTMMX can be connected to any of the four sensor ports of NXT by using standard cables from NXT set, or FlexiCable from mindsensors.com. Connect your motors to ports specified as M1 and M2. Connect NXT to port specified as 'NXT'. Additional Digital Sensors (or another NXTMMX) can be connected to port specified as 'Sensor'.

NOTE

Port specified as 'Sensor' on NXTMMX only supports I 2C or Digital sensors or multiplexers.

If you intend to daisy chain several NXTMMX's or other digital sensors, please read the relevant section from Advanced Information Appendix of this doc.

Mounting NXTMMX on your contraption

The holes on the NXTMMX enclosure are designed for tight fit of Technic pins (or axles) with '+' cross section. The holes however are not designed for repeated insertions/removals of these pins.

To mount NXTMMX on your contraption we suggest that you use two dark gray 'Technic Axle 3 with Stud' as shown.

I nsert axles from the top of the device and secure with a bushing on the back or mount it on your contraption directly.

Alternately, you may use blue 'Technic Axle Pin with Friction', as shown.

While disassembling contraption, leave the pins on the device.

Supplying power to your NXTMMX

The NXTMMX has Green terminals to connect external battery.

$$\Delta$$

NOTE

NXTMMX is rated for external power supply of 10 volts DC max. Ensure to not exceed this value. While connecting external battery, ensure correct polarity.

Battery Options:

6AA batteries (rechargeable or nonrechargeable). To hold and mount these batteries, you can purchase a holder with NXT mounts as shown here from Mindsensors.com website. <u>http://www.mindsensors.com/index.php?</u> module=pagemaster&PAGE_user_op=view_page&PAGE_id=146

RC rechargeable battery

- 7.2Volts or 9.6Volts Ni-CD or Ni-MH RC rechargeable battery. You can buy such battery and it's charger in local toy store.

To connect these batteries to NXTMMX, you can purchase following connector cable from mindsensors.com website: <u>http://www.mindsensors.com/index.php?</u> module=pagemaster&PAGE_user_op=view_page&PAGE_id=145

Lithium-Polymer Battery (also known as Li-Po or LiPo batteries) With NXTMMX, use 7.4 Volts battery. Select the capacity based on your load and anticipated duration of use. (For nominal load, we recommend 7.4Volts, 800 mAh battery.)

You can purchase these batteries in electronic hobby stores, or online RC toys stores. An example url is here:

To connect these batteries to your NXTMMX, you can purchase connector pins from mindsensors.com website.

<u>http://www.mindsensors.com/index.php?</u> <u>module=pagemaster&PAGE_user_op=view_page&PAGE_id=167</u>

Feature Highlights

Table below lists the important features provided by the NXTMMX. To use these features in your specific programming environment, please read your API help file (or NXT-G block help file) or program header file.

Feature	Description
Timed Control of each	Each motor can be run for a specified
motor	duration of time.
Encoder control of each	Each motor can be run from its
motor	current Encoder position to a new
	position (with or without a specific
	speed).
Speed control of each	Speed of each motor can be controlled
motor	in timed run or encoder based run.
Brake Vs Float while	Each motor can be set to Brake
stopping the motors	(where motor shaft can not be turned
	easily), Vs Float (where motor shaft is
	free to rotate by external force.
Holding Encoder position	At the end of run, hold the encoder
	position (i.e. motor turned by external
	force is restored to last set encoder
	position).
Turning motor by degrees	Move it in forward or reverse
	direction.
Turning motor by	360 degrees makes one rotation.
rotations	
Running operations	While a motor is running other
asynchronously	operations may be performed.
Running motors for	While motors are running, you can also
unlimited duration.	perform other operations. NOTE:
	When motors are set to run for
	'Unlimited Duration', they will continue
	to run until a Stop command is issued
	(or power is disconnected). In other
	words, after starting the motors for
	'Unlimited Duration' if your program
	exits without stopping the motors,
	they will continue to run.
Stopping motors abruptly.	
Reading Motor Encoders	You can read the value of each
	encoder from the NXTMMX.

Programming Techniques for NXTMMX

EV3 Method:

To use capabilities of the sensor, please download NXT blocks available at following URL: <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> _Document_id=235

Installation instructions for EV3 block are available at: http://www.mindsensors.com/pages/198

Download EV3 sample program from following URL and modify it to suit your needs. <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS_Document_id=248</u>

NXT-G Method:

Please download custom NXT block from following URL and import it into your NXT-G IDE.

<u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> <u>_Document_id=156</u>

If you need instructions on how to import this block in NXT-G, visit following url: <u>http://www.mindsensors.com/index.php?</u> module=pagemaster&PAGE_user_op=view_page&PAGE_id=81

Also download sample NXT-G programs from following URL and modify them to suit your needs: <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> <u>_Document_id=166</u>

RobotC Method:

Download the library file from following URL, and at the top of your RobotC program file, include it with following directive:

#include "NXTMMX-lib.h"

Download library file and sample program from following URL: <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> <u>_Document_id=163</u> Also, ensure to download the help file,

NXTMMX-README-RobotC-api.html, this file explains various functions available for your program.

Xander's RobotC Driver Suite:

Driver suite V1.4 or higher has built in support for NXTMMX. Please refer to following SourceForge URL for details: http://rdpartyrobotcdr.sourceforge.net/

NXC Method:

Download the library file from following URL, and at the top of your NXC program file, include it with following directive:

#include "NXTMMX-lib.nxc"

Library file URL: <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> _Document_id=154

Ensure to download the help file, **NXTMMX-README-nxc-api.html**, this file explains various functions available for your program. You can also download sample program from this location, and modify it to meet your needs.

NXT Firmware

If you are programming in NXT-G or NXC, it is recommended to use firmware available at URL below. This firmware implements digital communication enhancements that will improve reliability of communication between NXT and attached sensors/multiplexers. <u>http://www.mindsensors.com/index.php?</u> module=pagemaster&PAGE_user_op=view_page&PAGE_id=137

Current Characteristics

Average current consumption of this device is about 5.0 mA. NXTMMX can deliver upto 1 Amp current per NXT Motor attached. Drawing of excessively large current (such as incorrect motors or stalled motors) will result in internal shutdown until the situation is corrected.

I2C Bus address

Factory Default Address: 0x06

Changing the I2C Bus Address:

The I 2C bus address of NXTMMX can be changed. To set an address different from default address, send sequence of following commands on the command register:

OxAO, OxAA, OxA5, <new I 2C address> Note: Send these commands with no break/read operation in between. This new address is effective immediately. Please note down your address carefully for future reference.

You can download the address change and scan functions from our website at <u>www.mindsensors.com</u>. These functions are written in RobotC.

Alternately, you can download NXT executable programs from following location: <u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> <u>_Document_id=91</u>

APPENDIX A - Advanced Information

I2C Registers:

The NXTMMX appears as a set of registers as follows:

Register	Read	Write
0x00-	Firmware version - Vxxxx	-
0x07		
0x08-	Vendor I d - mndsnsrs	-
0x0f		
0x10-	Device I D - NxTMMX	-
0x17		
0x41	You can read the NXTMMX	Command
	battery voltage at this	
	register.	
	(voltage in milli-volts =	
	register value * 37).

	controller repeatedly reads	count gives more time to
	internal encoder ticks, this is	position internal encoder, thus
	the number of times the	providing better accuracy in
	encoder ticks reading should	positioning, but will take
	be within tolerance. (default	longer time. Change this only
	5)	if you need different motor
	3)	positioning speeds and
		accuracy. (For normal usage,
		default values will be OK).
0x87	Tolerance - The Tolerance (in	Tolerance – the accuracy you
	ticks) for encoder positioning.	desire while positioning. Low
	(default 80).	number will position the
		encoders more accurately, but
		may take longer time. Change
		this only if you need different
		motor positioning speeds and
		accuracy. (For normal usage,
		default values will be OK).
0x90	Voltage value	

Supported I2C Commands:

CMD	Hex	Description
R	0x52	Reset all Encoder values and motor parameters. (This
		does not reset the PID parameters).
S	0x53	Issue commands to both motors at the same time, for
		Synchronized starting of both motors.
		Motor Stopping Commands
а	0x61	Motor 1: Float while stopping.
b	0x62	Motor 2: Float while stopping.
С	0x63	Motor 1 and 2: Float while stopping.
А	0x41	Motor 1: Brake while stopping.

CMD	Hex	Description
В	0x42	Motor 2: Brake while stopping.
С	0x43	Motor 1 & 2: Brake while stopping.
		Encoder Reset Commands
r	0x72	Motor 1: Reset Encoder to zero
S	0x73	Motor 2: Reset Encoder to zero

These commands are issued on command register (0x41).

Motor Command Register Explained

Each motor has two command registers (Register A and Register B). In current release Register B is reserved for future use and must be set to zero.

Bits in Register A should be set to 1 to avail functionality as described below.

Register	Turn this bit to 1 for following functionality
Bit	
Least	Speed control of your motor. The NXTMMX will
significant	honor speed values specified in the speed register for
bit (bit 0)	the respective motor.
Bit 1	Ramp the speed up or down. While starting the
	motor or changing speed, the NXTMMX will ramp up or
	ramp down the power to new value.
	If this bit is zero, the power changes are sudden, e.g.
	full power is applied to motors as they start.
Bit 2	Relative change based on encoder values. This is
	useful when Bit 3 is turned on, and in this case, the
	NXTMMX will make a relative movement from last
	seen Encoder position (it will add the new Encoder
	position to old position and move to that resulting
	position). Useful when turning by degrees or rotations.
	If this bit is 0, the Encoder positions are taken as
	absolute values.
Bit 3	Encoder control of your motor. The NXTMMX will
	honor Encoder values specified in Encoder position
	register for respective motor. If speed values are also
	specified, and speed bit is set on, motors will rotate to
	new encoder position with the specified speed.
Bit 4	Brake or Float at the completion of motor
	movement. If this bit is 1, motor will Brake at the
	completion, otherwise it will float.
Bit 5	Encoder active feedback. This bit is used when
	Encoder control is used. If this bit is set to 1 at the
	completion of motor movement, the NXTMMX will
	continue to hold the Encoder position (i.e. if motor is

Register Bit	Turn this bit to 1 for following functionality
	turned by external force, NXTMMX will try to restore
	it to last specified Encoder position). If this bit is zero, the motor may float.
Bit 6	Timed control of your motor. The NXTMMX will
	honor the time specified value in 'Time to run' register and run the motor for specified time. (If Time control
	bit as well as Encoder Control bit is on, the Timed
	control has precedence over encoder control).
Most	GO. When this bit is set to 1, all above bit values are
significant	brought into effect. This is useful to synchronized
bit (bit 7)	starting of both motors. As it takes some time to
	write each motor's register values. The I 2C command
	'S' can be used to change these bits to 1 for both
	motors at once.

Motor Status Register Explained

Each motor has one status register. Each bit in status register indicates various situations with the motor as explained below.

Register	Value 1 indicates the situation is true
Bit	
Least	Speed Control is ON. Motor is programmed to move
significant	at a fixed speed.
bit (bit 0)	
Bit 1	Motor is Ramping (up or down). If the Power ramp is
	enabled, this bit is 1 while the motor is ramping (while
	changing its speed).
Bit 2	Motor is powered. (This may not mean motor is
	moving.)
Bit 3	Positional Control is ON. The motor is either moving
	towards desired encoder position or holding its
	position.
Bit 4	Motor is in Brake mode. (O value of this bit means
	motor is floating).
Bit 5	Motor is overloaded. If the external load prevents
	motor from achieving desired speed, this bit is set to
	1.
Bit 6	Motor is in timed mode. This bit is 1 while the motor
	is programmed to move for given duration.
Most	Motor is stalled. The external load caused the motor
significant	to stop moving.
bit (bit 7)	

Running Motors for Unlimited Duration

Not specifying Encoder Control or Timed Control bit will result in unlimited running of motor, (the speed control is honored if specified). To stop motors started with 'Unlimited Duration' use respective Stop command from the command set.

NOTE

A

When motors are set to run for 'Unlimited Duration', they will continue to run until a Stop command is issued (or power is disconnected). In other words, after starting the motors for 'Unlimited Duration' if your program exits without stopping the motors, they will continue to run.

How to detect if motor is moving or not moving:

In General: Anytime when the 'Stalled' bit is 1, the motor is not moving.

Running in encoder mode:

During moving: Position Control bit (bit 3) is 1 'Motor is Powered' bit (bit 2) is 1 Finished moving normally: All bits are zero Stopped due to stall: Position Control bit (bit 3) is 1 'Motor is Powered' bit (bit 2) is 1 Stalled bit (bit 7) is 1

Running in timed mode:

During moving: Timed Mode bit (bit 6) is 1 'Motor is Powered' bit (bit 2) is 1 Finished moving normally: All bits are zero Stopped due to stall (while time is not over): Timed Mode bit (bit 6) is 1 'Motor is Powered' bit (bit 2) is 1 Stalled bit (bit 7) is 1 Stopped due to stall (after time is over): All bits are zero.

Daisy chaining NXTMMX:

If you are daisy chaining upto 5 NXTMMX, you should change I 2C address of all but one NXTMMX. For example, change the second NXTMMX to address to 0x08, third to 0x10 and so on. (or something that does not conflict with any other device address that you are attaching on the same port).

12/14

You can download the address change executable programs from following location:

<u>http://www.mindsensors.com/index.php?</u> <u>module=documents&JAS_DocumentManager_op=viewDocument&JAS</u> _Document_id=91

I nstall the program on your NXT, attach the NXTMMX to Port 1 (attach only the NXTMMX for which you need to change the address), and run the program, follow on screen instructions to select new address and update it.

(With a pencil make a note of the new address on the NXTMMX). While using this NXTMMX in your program use the new address (picture below shows where to use the new address in NXT-G program):

If you are using any other programming environment, the API reference should indicate where to specify the new address.

Daisy chaining NXTMMX with NXTMMXs or other devices:

If you are daisy chaining 5 or more NXTMMX or other digital sensors, you may have to disable Pull up resistors in some of the devices. The Pull up resistors in NXTMMX can be disabled by installing a special firmware.

For special firmware with pull ups disabled, write an e-mail to Mindsensors Technology team.

Follow the firmware upgrade procedure mentioned above. Upon upgrade the NXTMMX must always be used with a device with Pull up resistor in it. (e.g. Ultrasonic Sensor)

TIP

Upon upgrade, write on the NXTMMX with a pencil that pull ups in it are disabled.

Theory behind this:

The I 2C specification specifies that there be only one pull up resistor on the I 2C bus. The specs also recommend that the pull up

resistor be in the master device, and slave devices should not have pull up.

In case of NXT, the pull ups are in sensors. When you daisy chain multiple sensors on one I2C bus, the pull ups start to add up, and that deteriorates the quality of communication between the NXT and the sensors. On a smaller scale (usually up to 5 devices) this deterioration has no effect on I2C network performance, however when you add more devices, you may encounter data errors.

Upgrading NXTMMX firmware:

The NXTMMX is shipped with latest stable firmware, if you need to change/upgrade the firmware, follow the procedure described at URL below. (Before you do this, you may need to get new firmware file from Mindsensors Technology team). http://www.mindsensors.com/index.php? module=pagemaster&PAGE_user_op=view_page&PAGE_id=121

If the Firmware Upgrader doesn't detect your NXTMMX, try this: When the firmware Upgrader is looking for device, attach the device, remove it momentarily and attach it again.
